

now check effect of mixing fn and true\_pos for agгло + edge and r3b + edge

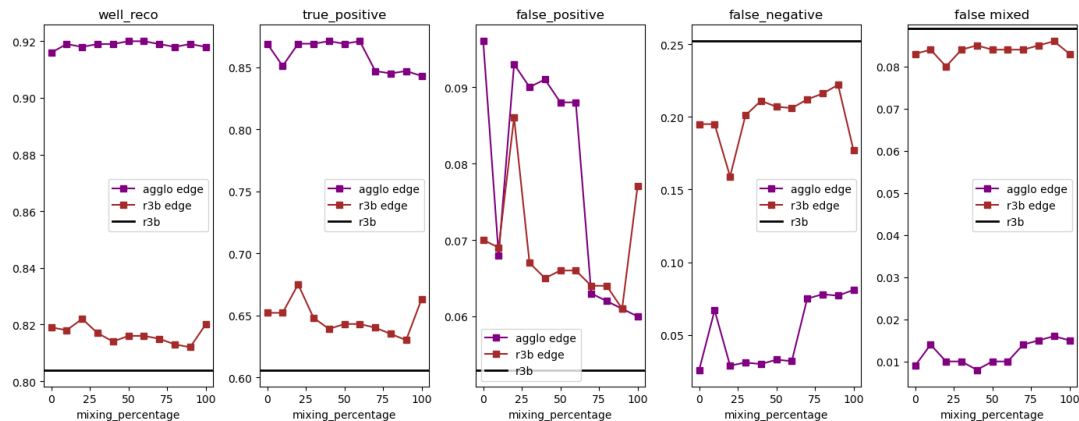

Lr= 9e-3, epochs = 80k

Uniform distributed Energy - SGD optimizer - mixing

Lr= 5e-3, epochs = 80k

Uniform distributed Energy - SGD optimizer - mixing

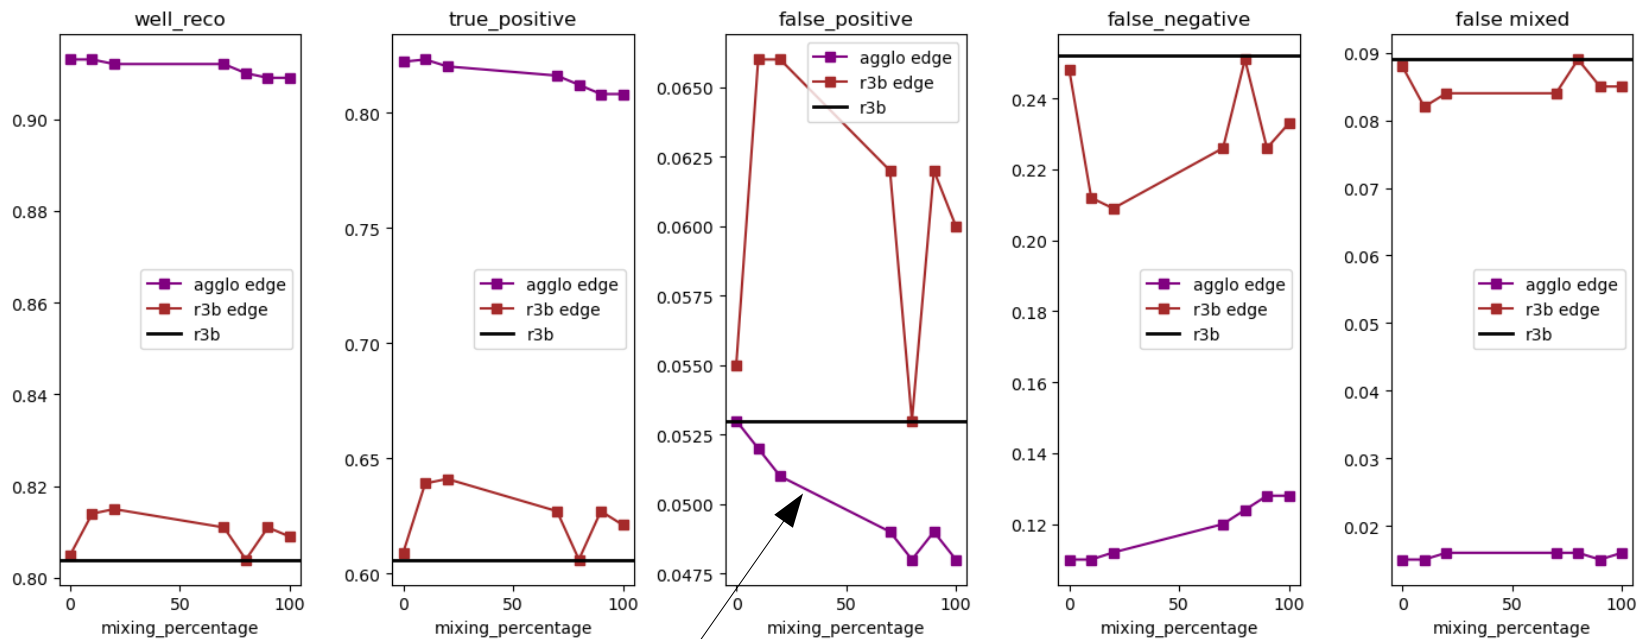

e.g. mixing percentage = 40 means that 40% true positive events is added to the number of the total fn\_events

Ok, now tuning also prediction cut: 0.75  $\rightarrow$  0.85

Lr= 5e-3, epochs = 80k

Uniform distributed Energy - SGD optimizer - mixing

This is good!

Next TODOs:

Plot loss function

Apply Agglo+Edge and R3B+Edge to 2.4 MeV peak data, make nice plot
